

String Bar Technology

Our string bar technology, used in our warp knitting machines, is able to selectively place functional yarn materials in desired structures during the process of fabric production.

Function is created by the choice of material as well as the design of the knitted structure.

You can find examples for functional warp knitted structures in our Media section.

String Bar Machine

The warp knitting process is a well-established production process that creates a high output of fabric for various applications.

With our newest generation of String bar machines, we are able to create fabrics with integrated functionality due to functional yarn materials.
