

ACTIVE HAPTIC FEEDBACK

Seristampa developed a new haptic touch HMI device, a specific answer to the growing need of advanced interactive touch surfaces.

With adjustable strong or light pressure, the device can simulate a switch, a mechanical slider or a rotary regulator on a flat or curved touch surface, transmitting the traditional mechanical feedback, which is instead a digital effect. This smart and pleasing all-in-one solution is also sturdy and therefore applicable to regular usage.

SUSTAINABLE DATA

This special application makes it possible for final users, installers and/or manufacturers to accede useful data and info, without wasting paper and time: Use NFC technology as a standard smartphone communication bridge with our patented communication technology and a very small transponder hidden in the HMI surface.

This so to say “invisible QR code” provides any kind of required info in a sustainable, easy and affordable way, in an aesthetic parts.
